

Project Requirements: Django + DRF Hybrid Approach

- Use Django for frontend rendering and URL routing.
- Use Django REST Framework (DRF) for all backend operations and API development.
- Create a base template using Django templates that includes CSRF token and static asset paths.
- Implement Django views (TemplateView or custom views) to render HTML pages.
- Use JavaScript inside templates to fetch data from DRF API endpoints using fetch or axios.
- Ensure CSRF token is available for any POST, PUT, or DELETE requests via JavaScript.
- Organize DRF logic using ViewSets and Routers for consistent RESTful APIs.
- Use serializers in DRF to validate and transform data for API consumption.
- Handle user authentication and permissions using Django's auth system and DRF permissions.
- Optional: Use Django ORM inside Django views to pass data directly to templates for simple pages.
- Optional: Use AJAX to make dynamic updates to the frontend based on API data.
- Maintain a clear separation between frontend and backend concerns in code organization.
